

NEWS RELEASE

University of Tennessee Baker School, TVA Release Landmark Clean Energy Study

- The economy-wide clean energy study for parts of seven Southeast states from the University of Tennessee Baker School of Public Policy and Public Affairs quantifies sources of greenhouse gas emissions and evaluates pathways to reach net-zero emissions across the Valley by 2050.
- Findings include that the Tennessee Valley region's 10 million residents generate about 200 million metric tonnes of carbon each year.
- Transportation is the largest source of carbon emissions in the region at 36% of the total and electrifying light-duty vehicles is the single largest carbon reduction opportunity, the study found.
- **Editor's Note:** [Click for downloadable video and audio](#) of Dr. Charles Sims, Director of the Center for Energy, Transportation, and Environmental Policy, at the University of Tennessee Baker School and TVA President and CEO Jeff Lyash.

JOHNSON CITY, Tenn. — The University of Tennessee, Knoxville, Baker School of Public Policy and Public Affairs presented the results of a landmark [Valley Pathways Study](#) on Wednesday at the quarterly meeting of the Board of Directors for the Tennessee Valley Authority. The study is the first of its kind for the region – which includes parts of seven Southeast states. This study quantifies carbon emission sources by economic sectors and evaluates actionable strategies for the region to achieve net-zero carbon emissions by 2050. The Baker School will provide future updates as data is available.

“The data is clear, there is no one solution to achieve net-zero emissions, and we must address the root cause across all economic sectors – where we work together – in order to drive meaningful change,” said Dr. Charles Sims, who was also recently named as TVA’s Inaugural Distinguished Professor of Energy and Environmental Policy. “Reducing greenhouse gas emissions is not just a case of electrifying everything and pushing the electricity sector to phase out all fossil fuels. Electricity still needs to strive toward net zero, but shifting all the responsibility to TVA, will not achieve economy-wide net-zero and may make achieving those goals more costly than it needs to be.”

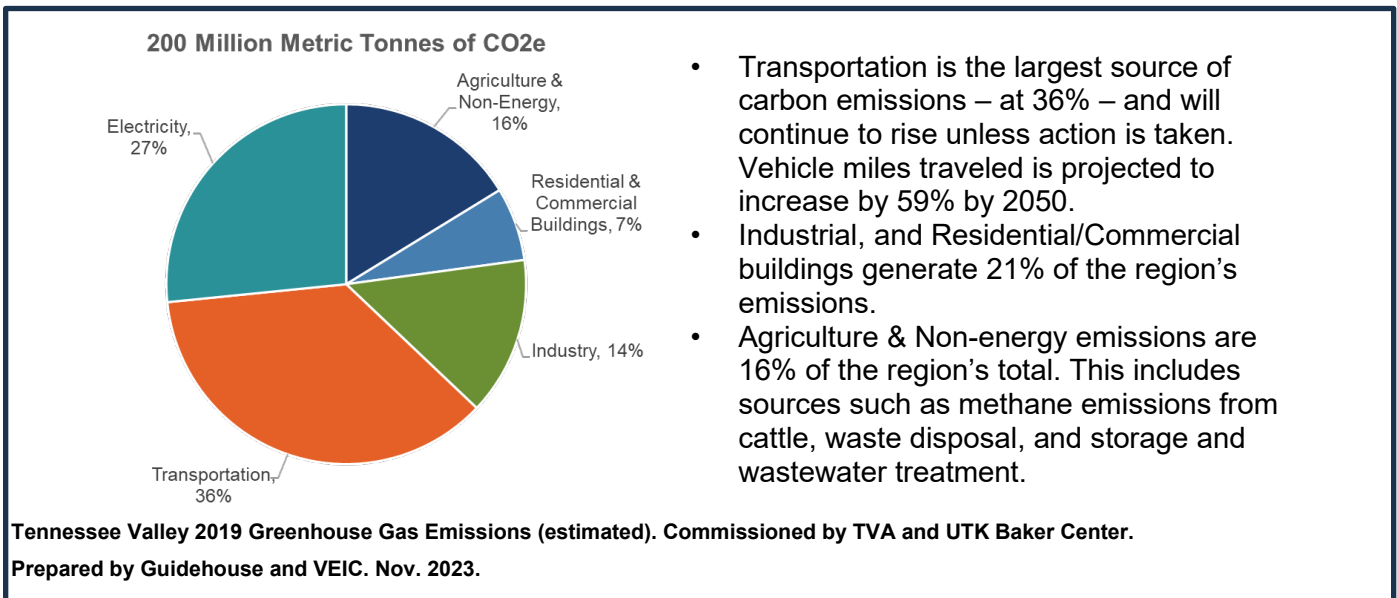

The study looked at carbon emissions and gathered data from 24 sources – including agricultural, transportation, industrial, residential – and used scenario-based analysis to compare various possible solutions to help determine the timing, scale and effect of achieving carbon reduction goals.

Key Insights

The Tennessee Valley region emits 200 million tonnes of carbon each year – about 3% of U.S. carbon emissions. As of 2019, the region’s carbon emissions have fallen by 78 million

tonnes or 30% since 2005 - much of this reduction is attributable to a 50% reduction in emissions from TVA's electricity generation and 39% reduction from agriculture due to the adoption of no-till farming. In FY23, 55% of TVA's overall power supply was carbon-free. Unlike the rest of the nation which still uses fossil fuels for 60% of its power. Reductions in the electricity sector alone are unable to bring the entire region to net-zero by 2050. If TVA achieved net-zero by 2050, the region would still produce almost 150 million tonnes of carbon. Therefore, support from other economic sectors is required.

Sims notes that 73% of the emissions are non-electricity related and the private sector is going to have to drive change as the region's population is projected to grow by 22% by 2050. "We are lucky to have a clean energy leader like TVA here in the Valley. While TVA has full responsibility for electricity generation, if we work together, we are likely to find low-hanging fruit that TVA could not achieve on their own," said Sims.

Carbon Reduction Solutions

The study modeled several actions that are building blocks for creating the net-zero economy of the future which include:

- **More Electric Vehicles** – Electrifying light-duty vehicles is the single largest carbon reduction opportunity. Between September 2022 and September 2023, the Southeast increased the number of electric charging stations by 69% and now has 15,036 stations across the region, according to the Southern Alliance for Clean Energy.
- **Make Homes/Businesses More Efficient** – High-efficiency heat pumps, LED lighting, and weatherizing buildings, can decrease emissions, reduce utility bills, and relieve stress on the energy grid. TVA is [investing \\$1.5 billion](#) in residential/commercial energy efficiency rebates to help consumers kickstart their savings.

- **Develop Low-Carbon Fuels** – Research and invest in low-carbon fuels to unlock emission reductions for aviation, trucks, and industry.
- **Education & Innovation** – Support every facet of a net-zero economy, from workforce training to research and development for carbon capture.

“Carbon reduction touches every household, business and community, and success means we must work together to develop actionable strategies to accelerate the transition to a clean-energy economy,” said TVA President and CEO Jeff Lyash. “As a clean energy leader, TVA is on the forefront to drive carbon reduction across all sectors of the economy and provide the clean power needed to give our region a competitive advantage. We will continue to work with all our partners across the region to achieve our clean energy goals, together.”

Business, community leaders and partners responded favorably to the study:

“TVA's significant investments in Kentucky spans electricity generation to natural resource management, economic development to connecting communities. The Valley Pathways Study builds on the foundation of reliable, resilient, low-cost power to meet the increasing energy demands of the future. The Study ultimately will help inform activities outlined in Governor Beshear's energy strategy where energy, economic development and the environment intersect to bring resilience community based, energy economic development opportunities that are affordable and sustainable.” **Evan Moser, Data Scientist, Office of Energy Policy Kentucky Energy and Environment Cabinet**

“Valley Pathways study is an unprecedented effort to develop decarbonization pathways across an entire region, and it should be a model for other regions in the United States looking to reduce carbon emissions across all sectors. By taking a holistic view of carbon reduction opportunities, this study provides a pathway for Valley-wide collaboration to achieve net zero carbon emissions by 2050.” **Dr. William Bryan, Director of Research, Southeast Energy Efficiency Alliance**

“The Valley Pathways Study should give folks that live in the Valley hope that with innovation there comes change – positive change – and that innovation can be found in the Valley. You don't have to look at the coasts. We can look right here in the southeast, we can look right here in Appalachia, we can look right here in the Tennessee Valley for some of the solutions that not only will help bring us a cleaner environment, but also new economic opportunities for our state and our country.” **Cortney Piper, Executive Director, Tennessee Advanced Energy Business Council**

“We must look at all the economic activities across the region because people are involved in different things that consume energy. Showing that carbon reduction is beneficial to them from the economic perspective, by adopting these strategies, they can help the environment and still improve their bottom line.” **Dr. Ignatius Fomunung**

**professor of civil engineering at the University of Tennessee at Chattanooga
College of Engineering and Computer Science**

“The Valley Pathways Study has been a big step forward in identifying both the challenges and potential solutions for the Tennessee Valley as we shift towards carbon-free energy. Being among this diverse group of stakeholders as we freely communicated our ideas, questions, and concerns, I have a much better view of the ‘big picture’, and how my role can positively impact it.” **Don Henderson, Energy Manager, USAG Redstone**

“Agriculture in the Valley is positioned to lead climate smart solutions through continued research and implementation of science based, economically sound practices. Farmers in the Tennessee Valley have a deep and abiding interest in the protection of the environment and are leaders in conservation practices which benefit the soil, water, and air. Modern agriculture is environmentally sustainable, and farmers strive to constantly improve the environmental resources in their care while playing a significant role in climate solutions.” **Kevin Hensley, Director of Public Policy, Tennessee Farm Bureau**

“This study will help address crucial gaps in access and affordability in communities where improvements are needed most. Low- and middle-income communities need help overcoming barriers to things like home energy efficiency upgrades, EVs and charging infrastructure, and the education and workforce development to support implementation of these technologies in the coming years. I look forward to continuing to work with the UT Baker School and TVA as we begin to reach out to local communities and congregations to take the results of this study and use them to find and implement efficient and environmental-justice-minded solutions for those who need them most.” **Professor Daniel Joranko, Coordinator, Tennessee Interfaith Power and Light**

“It can’t be overstated how important this study is, even if it’s just the first step. By recognizing that this conversation about climate is a priority and seeing it as an opportunity for all sectors of the economy, TVA creates a space for this conversation to occur. There’s a huge economic opportunity that the Tennessee Valley region is already seeing because of decarbonization efforts and commitments from TVA. This study is broadening that conversation, widening the tent, and highlighting how these efforts and opportunities impact everything from new manufacturing to community resilience.” **Erik Schmidt, Director of Sustainability, City of Chattanooga**

“The Nature Conservancy applauds TVA and the University of Tennessee for acknowledging the important role clean energy and nature will play in addressing climate change. Today forests in the Valley sequester about 17 Million Metric Tonnes of CO₂e. While this is not enough to offset emissions in the Valley and must be combined with a rapid transition to clean energy, the study shows that forests have an important role to play as a natural climate solution. This is a great case for doing more to protect forests and other natural areas for carbon sequestration, as well as the additional benefits of wildlife habitat, flood protection, recreation, and the timber economy. The Nature Conservancy looks forward to continuing to work to pair natural climate solutions with

carbon reductions across energy and other sectors to achieve a net zero future for the Tennessee Valley.” **Lindsay Hanna, Director of Government Relations & Climate Policy, The Nature Conservancy in Tennessee**

About the Howard H. Baker Jr. School of Public Policy and Public Affairs

The Baker School is the first and only school of its kind at any public university in Tennessee, and its mission is to graduate skilled public problem solvers prepared to take leadership roles as public servants, public administrators, policy analysts, policy entrepreneurs, or candidates for public office. Currently offering a master’s in public policy and administration degree and multiple undergraduate student programs providing mentoring support, networking opportunities, and firsthand experience in the world of public service, the Baker School teaches students to embrace the competition of ideas as a way of reaching more durable solutions, offering a way forward for those with the resolve to make things better.

About TVA

The Tennessee Valley Authority is the nation’s largest public power supplier, delivering energy to 10 million people across seven southeastern states. TVA was established 90 years ago to serve this region and the nation by developing innovative solutions to solve complex challenges. TVA’s unique mission focuses on energy, environmental stewardship, and economic development. With one of the largest, most diverse, and cleanest energy systems – including nuclear, hydro, solar, gas, and advanced technologies – TVA is a leader in our nation’s drive toward a [clean energy future](#).

TVA is a corporate agency of the United States, receiving no taxpayer funding, deriving virtually all of its revenues from sales of electricity. In addition to operating and investing its revenues in its electric system, TVA provides flood control, navigation, and land management for the Tennessee River system, and assists local power companies and state and local governments with economic development and job creation.
